

Chapter 4

Real and Complex Fourier Series

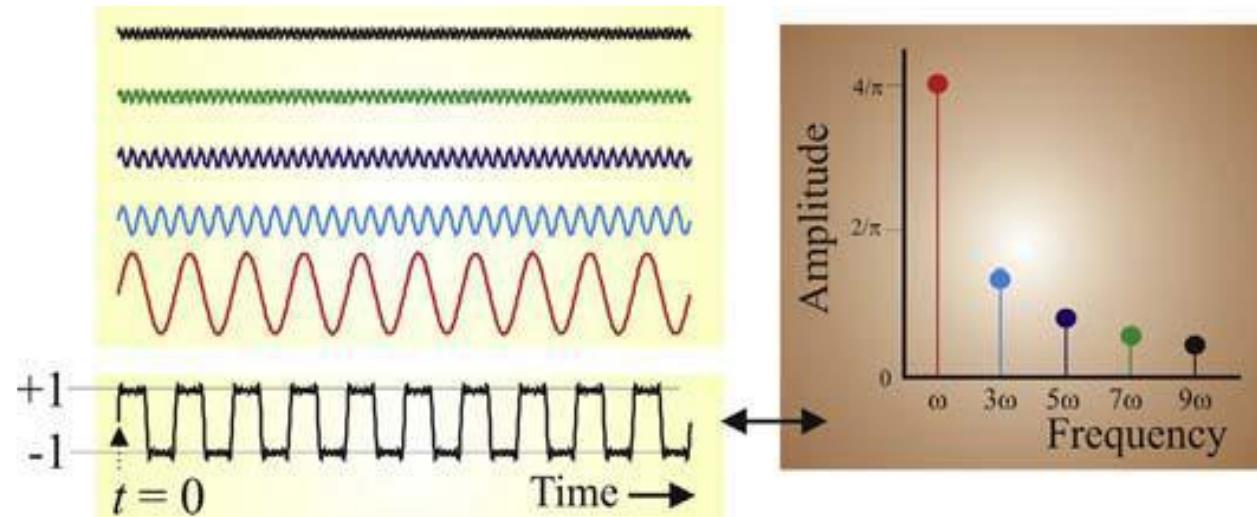

INTRODUCTION

The Fourier series as a technique to represent arbitrary periodic functions as a **summation of sine and cosine waves**. Also, the decomposition of signals into underlying frequency components is familiar to most; examples are the color spectrum obtained from decomposing white light with a **prism** or **decomposing sound into pure tone components**.

This example illustrates the basis of spectral analysis: a time domain signal (i.e., the [almost] square wave) can be decomposed into five sine waves, each with a different frequency and amplitude. The graph depicting these frequency and amplitude values in the figure is a frequency domain representation of the (almost) square wave in the time domain.

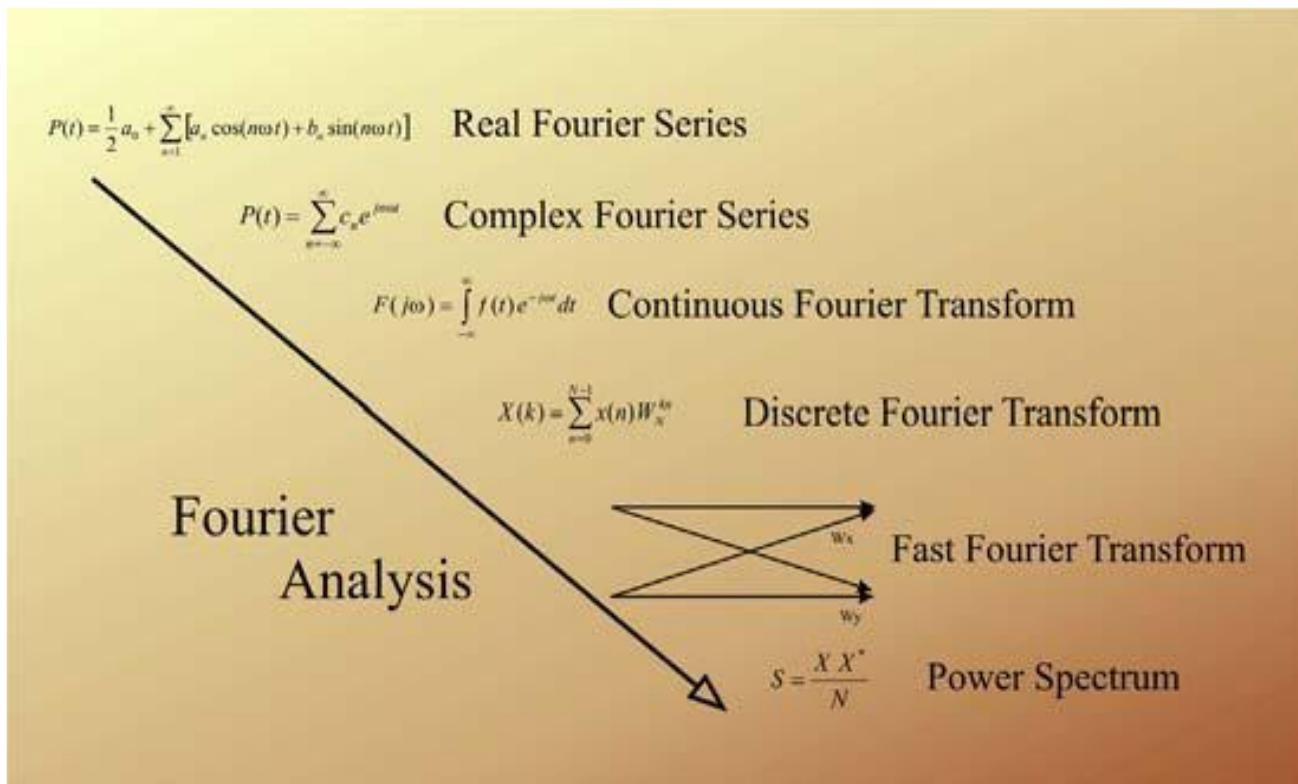

A prism performs spectral decomposition of white light in bands with different wavelengths that are perceived by us as different colors.

The sum of five sine waves approximates a square wave with amplitude 1 (bottom trace). The amplitude of the sine waves decreases with frequency. The spectral content of the square wave is shown in a graph of amplitude versus frequency (right).

different types of Fourier analysis

The relationship between different types of Fourier analysis. The real and complex Fourier series can represent a function as the sum of waves as shown in the previous slide. The continuous and discrete versions of the Fourier transform provide the basis for examining real-world signals in the frequency domain. The computational effort to obtain a Fourier transform is significantly reduced by using the fast Fourier transform (FFT) algorithm. The FFT result can subsequently be applied to compute spectral properties such as a power spectrum describing the power of the signal's different frequency components.

THE FOURIER SERIES

- The Fourier series provides a basis for analysis of signals in the frequency domain. In this section we show that a function $f(t)$ (such as the [almost] square wave in previous slide) with period T [i.e., $f(t) = f(t + T)$], frequency $f = 1/T$, and angular frequency ω defined as $\omega = 2\pi f$ can be represented by a series $P(t)$:

$$P(t) = \frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) + \cdots + b_1 \sin(\omega t) + b_2 \sin(2\omega t) + \cdots$$

$$= \frac{1}{2}a_0 + \sum_{n=1}^{\infty} [a_n \cos(n\omega t) + b_n \sin(n\omega t)]$$

- with the first term $1/2a_0$ representing the **DC (direct current) component**, and the remaining sine and cosine waves weighted by the **a_n and b_n** coefficients represent **the AC (alternating current)** components of the signal.

Minimization of the Difference Between P(t) and f(t)

The difference is considered the error of the approximation: i.e., the error E that is made by the approximation is $[P(t) - f(t)]$, which can be minimized by reducing E^2 over a full period T of the time series:

$$E^2 = \int_t^{t+T} [P(t) - f(t)]^2 dt \quad \partial E^2 / \partial a_n = 0 \text{ and } \partial E^2 / \partial b_n = 0$$

$$\partial \left[\int_t^{t+T} [P(t) - f(t)]^2 dt \right] / \partial a_n \rightarrow \int_t^{t+T} \partial \{ [P(t) - f(t)]^2 dt \} / \partial a_n$$

$$2 \int_T \left[(P(t) - f(t)) \frac{\partial (P(t) - f(t))}{\partial a_n} \right] dt = 0 \rightarrow \partial (P(t) - f(t)) / \partial a_n = \partial P(t) / \partial a_n$$

TABLE 5.1 Evaluation of $\partial P(t) / \partial a_n$ for Different Values of n

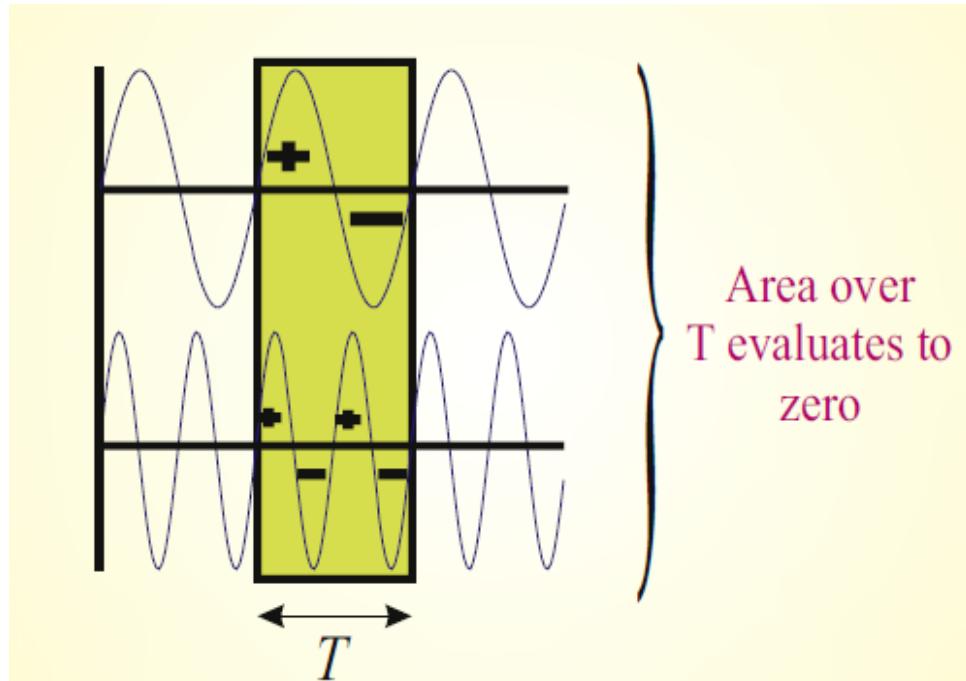

Index	Derivative
$n = 0$	$\partial P(t) / \partial a_0 = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial a_0 = 1/2$
$n = 1$	$\partial P(t) / \partial a_1 = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial a_1 = \cos(\omega t)$
$n = 2$	$\partial P(t) / \partial a_2 = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial a_2 = \cos(2\omega t)$
n	$\partial P(t) / \partial a_n = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial a_n = \cos(n\omega t)$

TABLE 5.2 Evaluation of $\partial P(t) / \partial b_n$ for Different Values of n

Index	Derivative
$n = 0$	Index does not exist for b coefficient
$n = 1$	$\partial P(t) / \partial b_1 = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial b_1 = \sin(\omega t)$
$n = 2$	$\partial P(t) / \partial b_2 = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial b_2 = \sin(2\omega t)$
n	$\partial P(t) / \partial b_n = \partial \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] / \partial b_n = \sin(n\omega t)$

Coefficients a_0 , a_n , b_n

- In the following sections we use the obtained results to derive expressions for the coefficients a_n and b_n . To simplify matters, we will frequently rely on two helpful properties: the fact that **(1)** the integral of a cosine or sine wave over one or more periods evaluates to zero, and **(2)** the orthogonal characteristics of the integrals at hand.

$$\int_T \cos(N\omega t) = 0 \text{ and } \int_T \sin(N\omega t) = 0$$

$$\int_T \cos(n\omega t)\cos(m\omega t)dt = \begin{cases} T/2 & \text{for } m = n \\ 0 & \text{otherwise} \end{cases}$$
$$\int_T \sin(n\omega t)\sin(m\omega t)dt = \begin{cases} T/2 & \text{for } m = n \\ 0 & \text{otherwise} \end{cases}$$
$$\int_T \sin(n\omega t)\cos(m\omega t)dt = 0 \text{ for all } m \text{ and } n$$

Orthogonal

Coefficients a_0

Returning to the a_n coefficients: for $n = 0$ we found that the derivative associated with minimization

evaluates to $\frac{1}{2}$. Substitution of this result into $2 \int_T [(P(t) - f(t)) \frac{\partial(P(t) - f(t))}{\partial a_n}] dt = 0$ gives us an expression for a_0 :

$$2 \int_T (P(t) - f(t)) \frac{1}{2} dt = \int_T P(t) dt - \int_T f(t) dt = 0 \rightarrow \int_T f(t) dt = \int_T P(t) dt$$

$$\int_T f(t) dt = \int_T \left[\frac{1}{2} a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots + b_1 \sin(\omega t) + \dots \right] dt$$

$$= \int_T \frac{1}{2} a_0 dt + \int_T a_1 \cos(\omega t) dt + \int_T a_2 \cos(2\omega t) dt \dots + \int_T b_1 \sin(\omega t) dt + \dots$$

$$\int_T f(t) dt = \frac{1}{2} a_0 \int_T dt = \frac{1}{2} a_0 T \rightarrow \boxed{a_0 = \frac{2}{T} \int_T f(t) dt}$$

avg

Coefficients a_1 and a_n

For $n = 1$ we obtained $\cos(\omega t)$ for the partial derivative (Table 5.1); substituting this result into

$$2 \int_T [(P(t) - f(t))\cos(\omega t)]dt = 2 \int_T P(t)\cos(\omega t)dt - 2 \int_T f(t)\cos(\omega t)dt = 0$$

$$\rightarrow \int_T f(t)\cos(\omega t)dt = \int_T P(t)\cos(\omega t)dt$$

Filling in the terms for
the Fourier series $P(t)$

$$\begin{aligned}
 \rightarrow \int_T f(t)\cos(\omega t)dt &= \int_T \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots \right. \\
 &\quad \left. + b_1 \sin(\omega t) + \dots \right] \cos(\omega t)dt \\
 &= \int_T \frac{1}{2}a_0 \cos(\omega t)dt + \int_T a_1 (\cos(\omega t))^2 dt + \int_T a_2 \cos(2\omega t) \cos(\omega t) dt \dots \\
 &\quad + \int_T b_1 \sin(\omega t) \cos(\omega t) dt + \dots
 \end{aligned}$$

Coefficients $a_1, a_n \dots$

- Therefore, all the terms in equation evaluate to zero, except simplify equation as follow:

$$\int_T f(t) \cos(\omega t) dt = \int_T a_1 (\cos(\omega t))^2 dt \quad \rightarrow \quad \int_T f(t) \cos(\omega t) dt = \int_T a_1 (\cos(\omega t))^2 dt = \int_T \frac{1}{2} a_1 [1 + \cos(2\omega t)] dt$$

$$\rightarrow \frac{1}{2} a_1 \left[\int_T dt + \int_T \cos(2\omega t) dt \right] = \frac{1}{2} [t]_0^T + 0 = \frac{T}{2} a_1$$

$$a_1 = \frac{2}{T} \int_T f(t) \cos(\omega t) dt$$

$\cos(A)\cos(A) = \frac{1}{2}[\cos(0) + \cos(2A)]$

The above procedure can be applied to find the other coefficients a_n . The integrals of the products $\cos(n \omega t) \times \cos(m \omega t)$ in the series all evaluate to zero with the exception of those in which $m = n$.

The property that products of functions are zero unless they have the same coefficient is characteristic of **orthogonal functions**. The integral of the products $\cos(n \omega t) \times \sin(m \omega t)$ all evaluate to zero also. This leads to the general formula for a_n :

$$a_n = \frac{2}{T} \int_T f(t) \cos(n \omega t) dt$$

f

Coefficients b_1, b_n

- For $n = 1$ we obtained $\sin(\omega t)$ for the partial derivative (Table 5.2); substituting this result into

$$2 \int_T [(P(t) - f(t))\sin(\omega t)]dt = 2 \int_T P(t)\sin(\omega t)dt - 2 \int_T f(t)\sin(\omega t)dt = 0$$

Filling in the terms for
the Fourier series $P(t)$

$$\longrightarrow \int_T f(t)\sin(\omega t)dt = \int_T P(t)\sin(\omega t)dt$$

$$\begin{aligned} \int_T f(t)\sin(\omega t)dt &= \int_T \left[\frac{1}{2}a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) \dots \right. \\ &\quad \left. + b_1 \sin(\omega t) + \dots \right] \sin(\omega t)dt \\ &= \int_T \frac{1}{2}a_0 \sin(\omega t)dt + \int_T a_1 \cos(\omega t) \sin(\omega t)dt \\ &\quad + \int_T a_2 \cos(2\omega t) \sin(\omega t)dt \dots + \int_T b_1 (\sin(\omega t))^2 dt + \dots \end{aligned}$$

0 0 0

Coefficients $b_1, b_n \dots$

$$\int_T f(t) \sin(\omega t) dt = \int_T b_1 (\sin(\omega t))^2 dt \rightarrow \int_T b_1 (\sin(\omega t))^2 dt = \int_T \frac{1}{2} b_1 [1 - \cos(2\omega t)] dt = \frac{1}{2} b_1 \left[\int_T dt - \int_T \cos(2\omega t) dt \right] = \frac{T}{2} b_1$$

$\sin(A)\sin(A) = \frac{1}{2}[\cos(0) - \cos(2A)]$

$$b_1 = \frac{2}{T} \int f(t) \sin(\omega t) dt$$

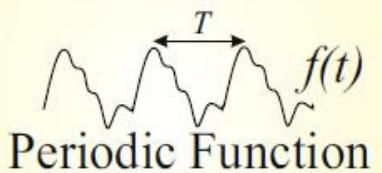

And finally, applying the same procedure to solve for b_n :

$$b_n = \frac{2}{T} \int_T f(t) \sin(n\omega t) dt$$

How much is present

Summary

(A)

(B)

$$P(t) = a_0 + a_1 \cos(\omega t) + a_2 \cos(2\omega t) + \dots + b_1 \sin(\omega t) + b_2 \sin(2\omega t) + \dots$$

Find minima of E^2

cosine terms $\frac{\partial E^2}{\partial a_n} = 0 \quad \text{and} \quad \frac{\partial E^2}{\partial b_n} = 0$

$$2 \int_T^{t+T} \left[(P(t) - f(t)) \frac{\partial (P(t) - f(t))}{\partial a_n} \right] dt = 0$$

(C)

$$\begin{aligned} n=0 &\rightarrow \frac{1}{2} \\ n=1 &\rightarrow \cos(\omega t) \\ n=2 &\rightarrow \cos(2\omega t) \quad \text{etc} \end{aligned}$$

$$\int_T^r f(t) \cos(\omega t) dt = \int_T^r P(t) \cos(\omega t) dt$$

$$\int_T^r f(t) \cos(\omega t) dt = \underbrace{\int_T^r a \cos^2(\omega t) dt}$$

$$\int_T^r 0.5 a_1 [1 + \cos(2\omega t)] dt$$

$$0.5 a_1 \left[\int_T^r 1 dt + \int_T^r \cos(2\omega t) dt \right] \rightarrow a_1 = \frac{2}{T} \int_T^r f(t) \cos(\omega t) dt$$

(D)

$$\begin{aligned} \int_T^r f(t) dt &= \int_T^r P(t) dt \\ \int_T^r f(t) dt &= \frac{1}{2} a_0 \int_T^r dt = a_0 T \end{aligned}$$

$$a_0 = \frac{2}{T} \int_T^r f(t) dt$$

sine terms

$$2 \int_T^{t+T} \left[(P(t) - f(t)) \frac{\partial (P(t) - f(t))}{\partial b_n} \right] dt = 0$$

(E)

$$\begin{aligned} n=1 &\rightarrow \sin(\omega t) \\ n=2 &\rightarrow \sin(2\omega t) \quad \text{etc} \end{aligned}$$

$$\int_T^r f(t) \sin(\omega t) dt = \int_T^r P(t) \sin(\omega t) dt$$

$$\int_T^r f(t) \sin(\omega t) dt = \underbrace{\int_T^r b_1 (\sin(\omega t))^2 dt}$$

$$\int_T^r 0.5 b_1 [1 - \cos(2\omega t)] dt$$

$$0.5 b_1 \left[\int_T^r 1 dt - \int_T^r \cos(2\omega t) dt \right] \rightarrow b_1 = \frac{2}{T} \int_T^r f(t) \sin(\omega t) dt$$

$$a_0 = \frac{2}{T} \int_T^r f(t) dt$$

$$a_n = \frac{2}{T} \int_T^r f(t) \cos(n\omega t) dt$$

$$b_n = \frac{2}{T} \int_T^r f(t) \sin(n\omega t) dt$$

Overview of the real Fourier series representation of $f(t)$, a periodic function (A). (B) The real Fourier series $P(t)$. (C) and (D) Determination of coefficients a_0 and a_1 in $P(t)$. (E) The same as (C) for the b_1 coefficient (note that there is no b_0). Determination of a_n and b_n coefficients is similar to the procedure for a_1 and b_1 .

THE COMPLEX FOURIER SERIES

The Fourier series of a periodic function is frequently presented in the **complex form**.
 The notation for the complex Fourier series is:

REAL FOURIER SERIES

$$P(t) = \frac{1}{2}a_0 + \sum_{n=1}^{\infty} [a_n \cos(n\omega t) + b_n \sin(n\omega t)]$$

$$a_0 = \frac{2}{T} \int_T f(t) dt$$

$$a_n = \frac{2}{T} \int_T f(t) \cos(n\omega t) dt$$

$$b_n = \frac{2}{T} \int_T f(t) \sin(n\omega t) dt$$

Complex FOURIER SERIES

$$P(t) = \sum_{n=-\infty}^{\infty} c_n e^{jn\omega t}$$

$$c_n = \frac{1}{T} \int_T f(t) e^{-jn\omega t} dt$$

$$e^{jx} = \cos(x) + j \sin(x)$$

Euler's
relation

$\int_T \dots$ indicates that the integral must be evaluated over a full period T , where it is not important what the starting point is.

e.g., $-T/2 \rightarrow T/2$ or $0 \rightarrow T$

The Real and Complex Fourier series notations are equivalent

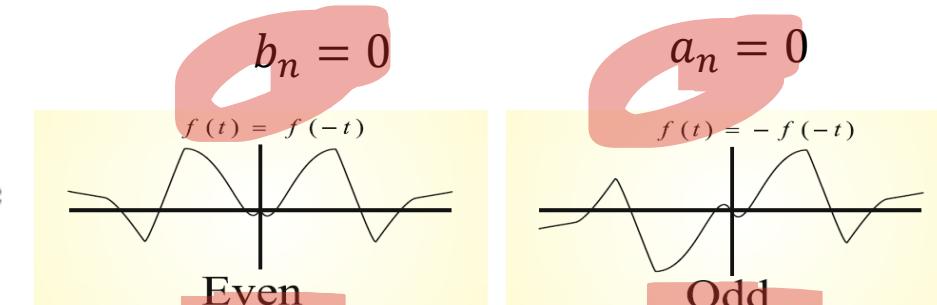

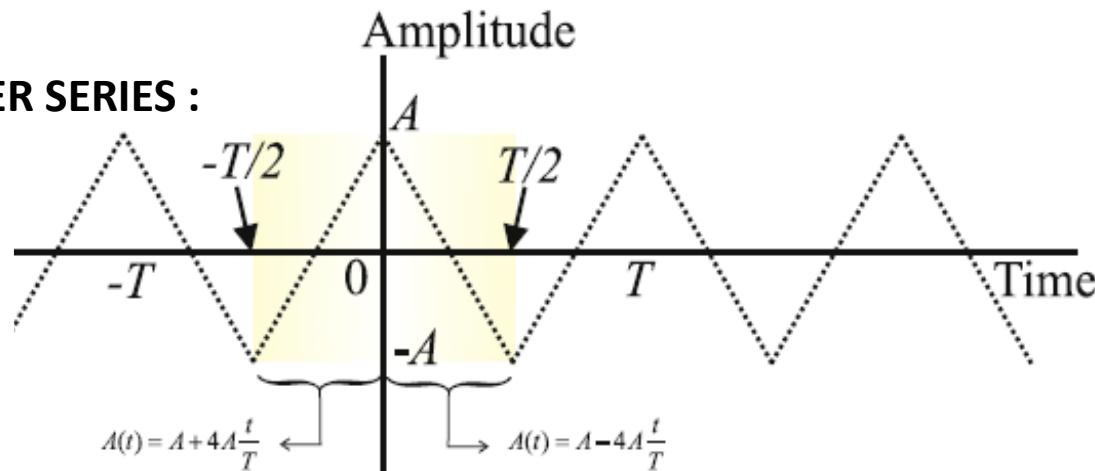

Example

Finding Real FOURIER SERIES :

$$a_0 = \frac{2}{T} \int_{-T}^T f(t) dt$$

$$a_n = \frac{2}{T} \int_{-T}^T f(t) \cos(n\omega t) dt$$

$$b_n = \frac{2}{T} \int_{-T}^T f(t) \sin(n\omega t) dt$$

$$f_{even} = (f(t) + f(-t))/2.$$

$$f_{odd} = (f(t) - f(-t))/2$$

$$f(t) = f_{even} + f_{odd} = \frac{f(t) + f(-t)}{2} + \frac{f(t) - f(-t)}{2} = \frac{2f(t)}{2} = f(t)$$

DC component is absent, therefore $a_0=0$.

The time series is even ,i.e., the sinusoidal odd components in the Fourier series are absent, therefore $b_n = 0$.

From these observations we conclude that we only have to calculate the a_n coefficients to obtain the representation of the real Fourier series. We can calculate these coefficients by integration over a full period from $T/2$ to $T/2$. In order to avoid trying to integrate over the discontinuity at $t = 0$, we can break the function up into two components.

3. $A(t) = A + 4At/T$ for $-T/2 \leq t \leq 0$, and
4. $A(t) = A - 4At/T$ for $0 \leq t \leq T/2$

$$a_n = \frac{2}{T} \int_T^T f(t) \cos(n\omega t) dt$$

$$a_n = \frac{2}{T} \int_{-T/2}^0 \left(A + 4A \frac{t}{T} \right) \cos(n\omega t) dt + \frac{2}{T} \int_0^{T/2} \left(A - 4A \frac{t}{T} \right) \cos(n\omega t) dt$$

$$a_n = \underbrace{\frac{2A}{T} \int_{-T/2}^0 \cos(n\omega t) dt + \frac{2A}{T} \int_0^{T/2} \cos(n\omega t) dt}_I + \underbrace{\frac{8A}{T^2} \int_{-T/2}^0 t \cos(n\omega t) dt - \frac{8A}{T^2} \int_0^{T/2} t \cos(n\omega t) dt}_II$$

■

$$\underbrace{\frac{2A}{T} \frac{1}{n\omega} [\sin(n\omega t)]_{-T/2}^0 + \frac{2A}{T} \frac{1}{n\omega} [\sin(n\omega t)]_0^{T/2}}_I = 0$$

$$\int t \cos(n\omega t) dt = \frac{1}{n^2 \omega^2} \int \underbrace{(n\omega t)}_u \underbrace{\cos(n\omega t) d(n\omega t)}_{dv}$$

with: $\begin{cases} u = n\omega t \rightarrow du = d(n\omega t) \\ dv = \cos(n\omega t) d(n\omega t) \rightarrow v = \sin(n\omega t) \end{cases}$

$t \rightarrow n\omega t \rightarrow \int \underbrace{(n\omega t)}_u \underbrace{\cos(n\omega t) d(n\omega t)}_{dv} = \underbrace{(n\omega t)\sin(n\omega t)}_{uv} - \int \underbrace{\sin(n\omega t)}_v \underbrace{d(n\omega t)}_{du} = (n\omega t)\sin(n\omega t) + \cos(n\omega t) + C$

$$a_n = \frac{2A}{n^2 \pi^2} \left(\left[\underbrace{\cos(0)}_1 - \underbrace{\cos(-n\pi)}_{\substack{-1 \\ \text{for } n=\text{odd}}} \right] - \left[\underbrace{\cos(n\pi)}_{\substack{1 \\ \text{for } n=\text{even}}} - \underbrace{\cos(0)}_1 \right] \right)$$

$a_n = \frac{8A}{(n\pi)^2}$ if n is odd
 $a_n = 0$ if n is even
